Recommended Cleaning Procedures

1. Always use fresh solvent as recommended by Momentive Performance Materials.
2. Keep the glazing area free of dust and do not allow dust and debris to be deposited on substrates where structural silicone sealant adhesion is required.
3. Silicones dry slowly. When using solvents to dry will redeposit any contaminants.
4. Use of proper method and the following cleaning procedures are essential to adhesion.
5. Clean only very small areas on exterior surfaces.
6. When using a glass cleaner, remember not to damage glass surfaces.
7. Always use clean, narrow-blade putty knife, or similar.
8. Use of proper method and the following cleaning procedures are essential to adhesion.
9. Decontamination of surfaces are recommended for metallic and nonmetallic materials. Metal, rubber, plastic, and other organic materials are attacked by solvents. This can contaminate the solvent.
10. Use of proper method and the following cleaning procedures are essential to adhesion.

Important Points on Using Solvent

- Always use clean, narrow-blade putty knife, or similar.
- Use of proper method and the following cleaning procedures are essential to adhesion.
- Decontamination of surfaces are recommended for metallic and nonmetallic materials. Metal, rubber, plastic, and other organic materials are attacked by solvents. This can contaminate the solvent.
- Use of proper method and the following cleaning procedures are essential to adhesion.
